1 Definition: Irreducible

For equivalent definitions, see Wiki [HERE](#); Also see "dense" on Wiki [HERE](#).

See Atiyah's [1] Exercise 19 from Chapter 1 for more information...

See Lemma 14. on Page 210 of [2] for equivalent characterisation of *irreducible*.

2 Example 1.1.3.

See Atiyah's [1] Exercise 19 from Chapter 1, which proves it must be dense.

For the sake of contradiction, assume a non-empty subset $A \subset X$ is reducible. Hence there exist two proper closed subset $A_1, A_2 \subset A$ such that $A = A_1 \cup A_2$. Then we have

$$X = (A^c \cup A_1) \cup (A^c \cup A_2),$$

which implies X is reducible.

✗!

2.1

See a post [HERE](#)

First approach applied some density argument. While the second approach, similarly, gave a decomposition of the whole space given the open set is reducible.

✓

3 Example 1.1.4.

See Atiyah's [1] Exercise 20 from Chapter 1.

4 Definition.

"Induced topology". Definition of *quasi affine variety*, see [HERE](#).

5 Prop 1.2 (d)

According to Hilbert's Nullstellensatz, I agree we'll get $I(Z(\mathfrak{a})) \subset \sqrt{\mathfrak{a}}$. For the reverse inclusion, pick any $f \in A$ such that $f^r \in \mathfrak{a}$ where $r \in \mathbb{Z}_{>0}$. We wish to show that $f(P) = 0$ for any $P \in Z(\mathfrak{a})$. By definition, $f^r(P) = 0$ given $f^r \in \mathfrak{a}$. And this implies

$$f^r(P) = (f(P))^r = 0 \Rightarrow f(P) = 0$$

given the polynomial ring A is an integral domain. Therefore we get the inclusion

$$I(Z(\mathfrak{a})) \supset \sqrt{\mathfrak{a}}.$$

See Theorem 6 on Page 183, Strong Nullstellensatz, [3].

9 Theorem 1.8A.

For transcendence degree, see [HERE](#) and a NOTE by Milne James.

10 Proposition 1.10.

Apart from the proof, we discussed *locally closed subset*. See [HERE](#) for its equivalent definitions.

11 Proposition 1.13.

See [HERE](#).

12 Exercise 1.1.

12.1 (a)

By definition of affine coordinate ring we have

$$A(Y) = A/I(Y) = A/I(Z(f)) = A/\sqrt{\langle f \rangle}.$$

While f is irreducible in U.F.D. $k[x, y]$, the ideal it generated will be a prime ideal, which is radical. Therefore we can further simplify the expression as

$$A/\sqrt{\langle f \rangle} = A/\langle f \rangle = k[x, y]/\langle y - x^2 \rangle = k[x].$$

Hence we can conclude $A(Y)$ is isomorphic to a polynomial ring in one variable over k .

12.2 (b)

13 Proposition 2.2.

There are two very technical claims need more details.

The first one is to prove $\varphi(Y) = Z(T') = Z(\alpha(T))$. Unwrap the notation precisely according to the definition

$$\begin{aligned} Z(\alpha(T)) &= \{ x \in \mathbb{A}^n \mid \alpha(g)(x) = 0 \ \forall \ g \in T \}, \\ \varphi(Y) &= \{ \varphi(y) \mid y \in Y \}. \end{aligned}$$

Notice that $y = [y_0, \dots, y_n] \in Y \subset \overline{Y} = Z(T)$, therefore $g(y) = 0$ for any $g \in T$. More precisely, we have

$$\alpha(g)(\varphi(y)) = g(1, y_1/y_0, \dots, y_n/y_0) = 0$$

given $g(y) = 0$ and $g \in T \subset S^h$, which proves $\varphi(Y) \subset Z(\alpha(T))$.

Conversely, let's start with an element $x = (x_1, \dots, x_n) \in Z(\alpha(T))$. There's an element $y = [1, x_1, \dots, x_n] \in Y$ such that $\varphi(y) = x$. Hence we've proved the equality.

And the second one is to check $\varphi^{-1}(W) = Z(\beta(T')) \cap U = Z(\beta(\alpha(T))) \cap U$.

14 Lemma 3.1.

See Sandor's Notes Lecture 4, Lemma 2.6.

Closedness can be checked locally. See a post [HERE](#).

15 Remark 3.1.1.

See Sandor's Notes Lecture 5, Corollary 2.10. Notice that Hartshorne defined variety to be irreducible. See a post explaining why the preimage is dense [HERE](#).

See Lemma 14. on Page 210 of [2].

16 Definition: Ring of Regular Function

[HERE](#) is an explicit description on the ring structure of $\mathcal{O}_{P,Y}$.

17 Theorem 3.2.

See Sándor's Lecture Notes 09, STEP 03. See solution of problem 3 [HERE](#).

See a post [HERE](#), [HERE](#).

17.1 (c)

for each P , $\mathcal{O}_P \cong A(Y)_{\mathfrak{m}_P}$, and $\dim \mathcal{O}_P = \dim Y$;

Proof. We begin with an injective homomorphism $\alpha : A(Y) \rightarrow \mathcal{O}(Y)$. And we define a map

$$\begin{aligned} A(Y)_{\mathfrak{m}_P} &\rightarrow \mathcal{O}_{P,Y} \\ f/g &\mapsto \langle V, \frac{\alpha(f)}{\alpha(g)} \rangle \end{aligned}$$

where $\frac{\alpha(f)}{\alpha(g)} \in \mathcal{O}(V)$. Now we wish to give an explicit description of V . Since $\alpha(f) \in \mathcal{O}(Y)$, we know there exists an open subset $P \in V_1 \subset Y$ such that

$$\alpha(f) \mid_{V_1} = \frac{h_1}{h_2} \mid_{V_1}$$

where $h_1, h_2 \in A$ and $0 \notin h_2(V_1)$. Since $\alpha(g) \in \mathcal{O}(Y)$, we know there exists an open subset $P \in V_2 \subset Y$ such that

$$\alpha(g) \mid_{V_2} = \frac{h_3}{h_4} \mid_{V_2}$$

where $h_3, h_4 \in A$ and $0 \notin h_4(V_2)$. Here $g \notin \mathfrak{m}_P$ by definition of localisation, which gives us

$$g(P) \neq 0 \Rightarrow \alpha(g)(P) \neq 0 \Rightarrow \exists V_3 \subset Y, \alpha(g) \mid_{V_3} \neq 0.$$

Then we take $V = V_1 \cap V_2 \cap V_3$ will suffice to work. This is because for any point $P \in V$, we have

$$\frac{\alpha(f)}{\alpha(g)} = \frac{h_1 h_4}{h_2 h_3}$$

for $0 \notin h_2 h_3(V)$.

$$\begin{array}{ccccc} A(Y) & \xrightarrow{\alpha} & \mathcal{O}(Y) & \hookrightarrow & \mathcal{O}_{P,Y} \\ & \searrow & & \nearrow & \\ & & A(Y)_{\mathfrak{m}_P} & & \end{array}$$

The induced map is given by universal property of localisation, for every elements in $A(Y) \setminus \mathfrak{m}_P$ will be mapped to a unit in $\mathcal{O}_{P,Y}$. And the map given by Lecture Notes 09 of Prof. Sándor satisfy the universal property (it makes the diagram commute and maps elements outside of \mathfrak{m}_P to units). \square

18 Proposition 3.3.

See a post [HERE](#).

19 Lemma 3.6.

See a post [HERE](#).

Here are some details for proving $x_i \circ \psi$ being regular implies ψ is a morphism: Coordinate functions means

$$\psi(p) = (\psi_1(p), \psi_2(p), \dots, \psi_n(p)) \in Y \subset \mathbb{A}^n$$

for any $p \in X$. Firstly, we check ψ is continuous. Take any closed subset $Z(f_1, \dots, f_r) \subset Y$ for some polynomial $f_1, \dots, f_r \in A = k[x_1, \dots, x_n]$. We can compute the preimage as

$$\psi^{-1}(Z(f_1, \dots, f_r)) = \{ p \in X \mid \forall p \in X, f_i \circ \psi(p) = 0 \}.$$

Notice that for any $p \in X$,

$$f_i \circ \psi(p) = f_i(\psi_1(p), \dots, \psi_n(p))$$

is continuous since f_i is a polynomial and each $\psi_i := x_i \circ \psi$ is continuous by assumption that they're regular. Notice that the preimage of ψ is precisely intersection of $\psi_i^{-1}(\{0\})$ where $1 \leq i \leq n$. Hence the preimage is closed, and it follows that ψ is continuous as expected.

Secondly, fix an arbitrary open subset $V \subset Y$ with an arbitrary regular function $g : V \rightarrow k$, we wish to prove $g \circ \psi : \psi^{-1}(V) \rightarrow k$ is regular. For any

$\psi(p) \in V$ with some $p \in X$, there exists a neighborhood $\psi(p) \in U \subset Y$ such that g equals to an expression of quotients of polynomial, i.e.

$$g = \frac{g_1}{g_2}$$

where $g_1, g_2 \in A$. Then for $p \in X$, take the open neighborhood of it as $\psi^{-1}(U)$, we can see

$$g \circ \psi(p) = \frac{g_1(\psi(p))}{g_2(\psi(p))}.$$

20 Example 1.0.3.

See some examples of presheaves that are not sheaves [HERE](#); a post [HERE](#).

In Wiki's page [HERE](#), it introduced non-separated presheaf, i.e. presheaf that doesn't satisfy locality axiom for sheaf.

21 Proposition-Definition 1.2.

See *Sheafification* on The Stacks Project.

See solution of problem 3 [HERE](#).

Of course, consult Ravi's Notes on Sheafification;
or see Section 6.5 on Page 232 of [2].

Also, see a REU paper [HERE](#) by Daping Weng.

A short paper by Tom is [HERE](#).

22 Definition: Inverse Image Sheaf

See Wiki for motivation of such definition.

See a POST that gives more details, as well as a counterexample.

23 1.3.F. EXERCISE.

A post discussing this problem is [HERE](#).

24 1.3.N

A crutial step is to define the map such that the diagram commute. In order to prove it satisfies the universal property. We're given A be arbitrary with map $g : A \rightarrow X$ and $f : A \rightarrow Y$.

We can to define

$$\begin{aligned}
 \varphi : A &\rightarrow X \times_Z Y \text{ by} \\
 a &\mapsto (g(a), f(a)).
 \end{aligned}$$

And we can verify this definition will make the diagram commute, and is unique.

25 1.3.O

It's indeed intersection. A post [HERE](#).

A post [HERE](#).

26 1.3.P.

Say we have $X \times Y$ and $X \times_Z Y$. By universal property of product and fibered product we can produce two unique map goes in between. Their composition must be identity, hence they're isomorphic. Notice it's important for Z being a final object.

$$\begin{array}{ccc}
 X \times Y & \xrightarrow{\pi_2} & Y \\
 \pi_1 \downarrow & & \downarrow \beta \\
 X & \xrightarrow{\alpha} & Z
 \end{array}$$

When we trying to make a map from $X \times Y$ to $X \times_Z Y$, we have to make sure two maps

$$\beta \circ \pi_1 = \alpha \circ \pi_1$$

on $X \times Y$. While Z is the final object, hence they must agree.

There's a cleaner way to state it [HERE](#). Crutial part is applying final property of object Z .

27 1.3.Q.

Label the maps as indicated. To prove the universal property with respect to the "outside rectangle", we're given

$$f_6 f_3 g_1 = f_7 g_2$$

agree on A . While W is fibered product, apply universal property of fibered product with respect to W we immediately get a unique map

$$\psi : A \rightarrow W$$

that makes the diagram involving A, W, X, Y, Z commute. In particular, we know $f_4 \psi = f_3 g_1$. Furthermore, recall that U is the fibered product. We're given the condition that $f_4 \psi = f_3 g_1$, by universal property of U we know there exists a unique map

$$\varphi : A \rightarrow U$$

making the diagram involving A, U, V, W, X commute. And we claim that the diagram involving A, U, V, Y, Z commute. This is because

$$g_2 = f_5 \psi = f_5 f_2 \varphi = (f_5 f_2) \varphi \quad \text{and} \quad g_1 = f_1 \varphi.$$

And this proves that U is the fibered product for the diagram involving A, U, V, Y, Z .

A post is [HERE](#).

28 1.3.R

By the universal property of $X_1 \times_Z X_2$, we know there exists a unique map

$$\varphi : X_1 \times_Y X_2 \rightarrow X_1 \times_Z X_2$$

"Natural morphism", a convention discussed [HERE](#).

29 Course Notes from Cornell

See [HERE](#).

30 1.3.S. Magic Diagram

Didn't finish. Need to See [HERE](#), [HERE!!!](#)

31 1.3.Y. (a)

YONEDA'S LEMMA Given what we have, define $g : A \rightarrow A'$ as

$$g := i_A(\text{id}_A).$$

This is correct, see a post [HERE](#).

32 1.4.C.

(a) See "A Term of Commutative Algebra", Example 7.3 on Page 52.

33 1.6.B.

Write out everything by definition, and we can finish the proof immediately by applying rank-nullity theorem for linear transformation...

34 2.2.6. Definition: Sheaf.

Comments on $\mathcal{F}(\emptyset)$. In category **Set**, the empty set is initial object and one element set is terminal. See Wiki's examples [HERE](#).

35 2.2.B.

For (a): see Wiki's counterexample [HERE](#), which gave an explanation for presheaves on \mathbb{R} instead of \mathbb{C} . See a post [HERE](#).

36 2.2.7.

See Daping's Notes Definition 2.5 on Page 4 [HERE](#); also a post [HERE](#); also a post [HERE](#).

37 2.2.10.

It's different from a post [HERE](#), and Wiki's page on Constant pre-Sheaf.

Why???

38 2.2.G.

It's clearly a pre-sheaf.

Fix an open subset $U \subset X$ with an open cover $\{U_i\}_{i \in I}$ for some index set I . Denote the presheaf as \mathcal{F} .

Pick two continuous maps $s_1, s_2 : Y \rightarrow X$ that satisfying the requirements, i.e. $s_1, s_2 \in \mathcal{F}(U)$.

Both functions will agree on U since

$$\text{Res}_{U, U_i} s_1 = \text{Res}_{U, U_i} s_2$$

for arbitrary U_i , whose union is U . So we must have $s_1 = s_2$.

Again with this open cover $\{U_i\}_{i \in I}$ and $a_i \in \mathcal{F}(U_i)$ for $i \in I$. Equivalently, we know $a_i : U_i \rightarrow Y$ is a continuous map satisfying $\mu \circ a_i = \text{Id}|_{U_i}$. Now let's define a map

$$\begin{aligned} f : U &\rightarrow Y \\ u &\mapsto a_i(u) \text{ when } u \in U_i. \end{aligned}$$

It's well-defined by our assumption. Also it's continuous since preimage of an open set in $V \subset Y$ is a union of open subsets given by continuity of each a_i . Similarly we can check $\mu \circ f = \text{Id}|_U$ as expected.

Unverified ?

39 2.2.11. Espace Étale

See a post discussion accent letter in LaTeX [HERE](#).

See an exercise in [4] Chapter 2, Exercise 1.13.

See the discussion after Lemma 7. on Page 229 of [2].

For *section*, see Wiki's explanation for *section* in context of fiber bundle; and *section* in terms of category theory.

40 2.3.A.

I'm planning to use universal property to define the induced map ϕ_P .

One crucial step is to verify the diagram below is commutative

$$\begin{array}{ccc}
 \mathcal{F}(U) & \xrightarrow{\rho_{UV}} & \mathcal{F}(V) \\
 \phi(U) \downarrow & & \downarrow \phi(V) \\
 \mathcal{G}(U) & \xrightarrow{\tau_{UV}} & \mathcal{G}(V) \\
 & \searrow & \swarrow \\
 & \mathcal{G}_P &
 \end{array}$$

And this is because the square diagram in the upper half commute given ϕ is a natural transformation; the lower half is by definition of \mathcal{G}_P . Then by universal property of colimit induces a map

$$\phi_P : \mathcal{F}_P \rightarrow \mathcal{G}_P$$

which makes the diagram commute.

See a post defined the map [HERE](#).

41 2.3.B.

To define a functor $\pi_* : \mathbf{Set}_X \rightarrow \mathbf{Set}_Y$. Firstly, we have to define for any $\mathcal{F} \in \mathbf{Set}_X$,

$$\pi_*(\mathcal{F})(U) = \mathcal{F}(\pi^{-1}(U))$$

for any $U \in \mathbf{Top}(X)$ as in ??.

Secondly, for any natural transformation $\phi : \mathcal{F} \rightarrow \mathcal{G}$, we define $\pi_*(\phi)$ by specifying

$$\pi_*(\phi)(U) \mapsto \mathcal{F}(\pi^{-1}(U)) \rightarrow \mathcal{G}(\pi^{-1}(U)).$$

? Is this correct
